1 INTRODUCTION

1.1 Object

The specification of the radio transmitter Linky and downstream interface is a partnership project between EDF and IGNES sponsored by Smart Lyon project accompanied by ADEME as part of the program Development of the Digital Economy - Action Smart Grid for Future Investments

1.1.1 Context

Behavior in terms of power consumption change due to:

- The guidance of public authorities to more energy sobriety
- The energy policies driven by the territories
- The more fundamental changes in lifestyles.

Intelligent electrical systems, in particular through the deployment of smart meters, will provide the public with energy data easily accessible and understandable by all.

This evolution will give rise to the development of new products and services which themselves can influence consumer behaviors and allow living the energy more simply.

The market for smart grids is at the heart of the green economy with a high growth potential including the international market.

1.1.2 Description

This specification is intended to be used by manufacturers of downstream equipment for the radio interface with the ERL device.

The ERL is an electronic device whose function is to broadcast to downstream equipment, under a two-way radio protocol (KNX, Zigbee), the information transmitted via the customer teleinformation (TIC) by the Linky meter.

The ERL is intended for being plugged into the Linky smart meters which will have, under their cover, a location for this insertion.

To be able to communicate properly with the ERL, the downstream equipment must have some particular specification.

This document is a reference for the common behavior that all downstream equipment should have.

1.2 Document organisation

This document is organised by life cycles of the product to realize: conception, nominal mode, configuration, special events. It is formulated with requirements in order to be able to follow every item between its specifications to its validation.

1.3 Glossary

ERL	Emetteur Radio Linly (Radio Transmitter Linky)
ZB	ZigBee
ZTC	ZigBee Trust Center
ZR	ZigBee Routeur
ZED	ZigBee End Device
LRZR	Linky Ready ZigBee Routeur
LRZED	Linky Ready ZigBee End Device
IC	Install code
TC Link Key	Key used by TC for encryption of network key
MMI	Man Machine Interface
DPT	KNX datapoint

2 CONCEPTION PHASE

2.1 Hardware requirements

2.1.1 Electronic architecture

CON-SUE-HDW-FC-001	Implement following specific characteristics for CPU	1.0
The downstream interface must have a wireless chip that fully supports at least one the following solutions: - ZigBee Pro 2012; ZigBee will operate in 2.4 GHz radio band. - or KNX RF Multi with Fast Link Acknowledgement (frequency band 868 MHz)		
Class : Non-functional		
Upstream Requirement(s) :	Derived	Verif. level : verification

2.1.2 Man Machine Interface

CON-SUE-HDW-FC-002	Allow manual equipment configuration	1.0
The downstream interface must have at least a Push Button or any kind of MMI to launch creating a link with the ERL.		
Class : Non-functional		
Upstream Requirement(s) :	Derived	Verif. level : verification

2.1.3 Clock

On the ERL, there is no clock to manage the periodic send of data based on real hours.

The historical TIC does not give the hour.

In order to manage this kind of data reception, it is recommended but not mandatory to implement a RTC in the downstream equipment.

2.1.4 Radio frequency Input / Output

A downstream interface must **satisfy at least one of the two following requirements:**

2.1.4.1 ZigBee

CON-ERL-PTC-FC-001	Adapt to the automation network using the ZigBee protocol.	1.0
The ZigBee downstream interface must be able to communicate with the ERL using the ZigBee protocol as following :		
ZigBee Pro 2012 must be used.		
ZigBee will operate in 2.4 GHz radio band.		
It must be compatible with the ZHA1.2 and later versions.		
Refer to document ref (7)		
Class :	Non-functional	Verif. level : verification
Upstream Requirement(s) :	Derived	

2.1.4.2 KNX

CON-ERL-PTC-FC-002	Adapt to the automation network using the KNX protocol.	1.0
The KNX downstream interface must be able to communicate with the ERL using the KNX protocol as following :		
The standard KNX to use is the KNX RF Multi with Fast Link Acknowledgement (frequency band 868 MHz KNX RF1.M)		
Refer to document ref (5)		
Class :	Non-functional	Verif. level : verification
Upstream Requirement(s) :	Derived	

2.2 Electromagnetic compatibility requirements

In order to comply with R&TTE directives to get the CE marking, the following standards must be respected.

2.2.1 Radio Standards

2.2.1.1 For KNX

CON-CPT-ELM-FC-001	Respect radio standard for KNX emission.	1.0
The KNX downstream equipment must respect the radio standard for KNX emission EN 300220-1 et EN 300220-2		
Class :	Non-functional	Verif. level : verification
Upstream Requirement(s) :	Derived	

2.2.1.2 For ZigBee

CON-CPT-ELM-FC-002	Respect radio standard for ZigBee emission.	1.0
The ZigBee downstream equipment must respect the radio standard for ZigBee emission EN 300328.		
Class :	Non-functional	Verif. level : verification
Upstream Requirement(s) :	Derived	

2.2.2 EMC Standard

2.2.2.1 For KNX

CON-CPT-ELM-FC-003	Respect CEM standard for KNX.	1.0
The KNX downstream equipment must respect the EMC standard for KNX EN 301 489-1 et EN 301 489-3.		
Class :	Non-functional	Verif. level : verification
Upstream Requirement(s) :	Derived	

2.2.2.2 For ZigBee

CON-CPT-ELM-FC-004	Respect CEM standard for ZigBee.	1.0
The ZigBee downstream equipment must respect the EMC standard for ZigBee EN 301 489-1 et EN 301 489-17.		
Class :	Non-functional	Verif. level : verification
Upstream Requirement(s) :	Derived	

2.3 Automation context requirements

CON-CTX-DOM-FC-001	Respect the security and performance of automation equipment	1.0
The downstream interface must be ZigBee or KNX RF Multi certified.		
Class :	Non-functional	Verif. level : verification
Upstream Requirement(s) :	Derived	

3 NOMINAL USE PHASE

This is the main mode of use, installation of network done, without any addition or removal of device on the network.

NOM-TRF-INF-FP-001	Retrieve information from the ERL device	1.0
<i>The downstream equipment is responsible for retrieving information from the ERL</i>		
Class :	Non-functional	Verif. level : verification
Upstream Requirement(s) :	Derived	

3.1 Data processing

This paragraph gives the format for all information gathered in the TIC and sent to the downstream equipment for every RF mode.

3.1.1 For KNX

3.1.1.1 For the historical physical layer:

3.1.1.3 Easy channels

To connect with ERL, the downstream device has to select the relevant datapoints and connection codes for the application.

It has to be noted that as the change between TIC modes (historical or standard) is automatic the downstream device has to connect to all relevant data allowing at configuration allowing an automatic adaptation of the behaviour.

ERL Channel

- **Name:** CH_TIC
- **ID:** 0589h
- **Classification:** Sensor
- **Functional Block:**
 -
- **General functional description:**

This channel relays the TIC information given by a meter using the TIC connection.

- **Data point list:**

Index	Datapoint Name	DPT	Connection Code	Flags
0	Launch the temporary sending of drawn power	1.01 0	DPT_Start	CC_Timed
1	Launch the sending of all the active tariff energy	1.01 0	DPT_Trigger	CC_Trigger
2	Launch the sending of all the prices.	1.01 0	DPT_Trigger	CC_Trigger_Price

3.1.1.4 Timestamps

3.1.1.4.1 Timestamp for values on change

ERL is able to send the specific value with timestamp stored on change. Downstream device can access thru a request as described in §3.2.3

The list of these values is below (no value for historical TIC concerned, only values for standard TIC and on change mode and same mode of send for on demand mode in these cases)

Standard physical layer:

TIC ERDF Labels	Information TIC	Data
Bit 7 of STGE	Reference power exceeded	2 (instantaneous value + timestamp)
MSG1	Short message	2 (MSG + Timestamp)
MSG2	Ultrashort message	2 (MSG + Timestamp)
Bits 1 à 3 of STGE	State of the breaker	2 (Value + timestamp)
Bit 4 of STGE	State of the DNO (Distribution Network Operator) cover terminal	2 (Value + timestamp)
Bit 6 of STGE	Excess voltage on one of the phases	2 (Value + timestamp)
Bit 9 of STGE	Active power direction	2 (Value + timestamp)
Bit 16 of STGE	Downgraded clock mode (loss of the internal clock's timestamp)	2 (Value + timestamp)
Bits 19 & 20 of STGE	Euridis communication output state	2

TIC ERDF Labels	Information TIC	Data
		(Value + timestamp)
Bits 21 & 22 of STGE	Status CPL	2 (Value + timestamp)
Bit 23 of STGE	CPL synchronization	2 (Value + timestamp)

3.1.1.4.2 Timestamp of last changed values

ERL is able to send the timestamp of the last change for some specific values.

Data received : instantaneous value + timestamp of the last change.

The list of these values is below (no value for historical TIC concerned, only values for standard TIC and on change mode and same mode of send for on demand mode in these cases)

Standard physical layer:

TIC ERDF Labels	Information TIC	Data
PREF	Apparent ref. power	2 (instantaneous values + timestamp of the last change)

3.1.1.4.3 Timestamp of occurrence for specific values

ERL is able to send the timestamp of the occurrence of the last change for some specific values.

Data received: instantaneous value + timestamp of the occurrence of the last change

The list of these values is below (no value for historical TIC concerned, only values for standard TIC and on change mode and same mode of send for on demand mode in these cases)

Standard TIC :

TIC ERDF Labels	Information TIC	Data
Bits 28 & 29 of STGE	Moving peak prior notices	2 (Values + timestamp of occurrence)

3.1.1.4.4 Snapshot for index of energy consumption

ERL is able to send snapshots for some specific values for display for example.
 For groups of data (index for historical TIC and active energy extracted for standard TIC), values can be received with snapshots : one value for each data every 10 mn, first value sent on hour and a timestamp for each value
 Data received : instantaneous values every 10 mn, first value on hour + timestamp of each value
 The list of these values is below
 Note: If time is not available (i.e Historical TIC), the time stamp value for instantaneous reading is the number of elapsed seconds from the last snapshot. The downstream equipment is then able to calculate the absolute time of the last snapshot.

Snapshot by steps of 10 mn synchronized on start of hour.

Historical physical layer:

TIC ERDF Labels	Information TIC	Data
BASE	Basic option index	2 (Values of snapshot every 10 minutes + timestamp)
HCHC HCHP	Off-Peak Hours Full Hours	4 (Values of snapshot every 10 minutes + timestamp)
EJPHN EJPHPM	EJP option Index Normal hours Moving Peak Hours	4 (Values of snapshot every 10 minutes + timestamp)
BBRHCJB BBRHPJB BBRHCJW BBRHPJW BBRHCJR BBRHPJR	Tempo option Index : Off peak hours blue days Peak hours blue days Off peak hours white days Peak hours white days Off peak hours red days Peak hours red days	12 (Values of snapshot every 10 minutes + timestamp)

If there is no way to get the hour (no clock given by any device on the network), the ERL can manage a relative time without starting at the beginning of an hour. It can try to synchronize with the beginning of the period off peak hours / peak hours.

Standard TIC :

TIC ERDF Labels	Information TIC	Data
EASF01 EASF02 EASF03 EASF04 EASF05 EASF06 EASF07 EASF08 EASF09 EASF10	Supplier active power drawn index01 index 02 index 03 index 04 index 05 index 06 index 07 index 08 index 09 index 10	20 (Values of snapshot every 10 minutes + timestamp)
EASD01 EASD02 EASD03 EASD04	Distributor active power drawn index01 index 02 index 03 index 04	8 (Values of snapshot every 10 minutes + timestamp)

3.1.1.4.5 Apparent power curve data

ERL is able to buffer a table with apparent power (PAPP or SINSTS or SINST1,2,3) with a measurement each 2 seconds and to send it.

For KNX RF, ERL must use a property request as described in §3.1.1.5

ERL stores a table with data each 2 seconds for 2 minutes whatever is the TIC update period

Sequence number	DateTime on 8 bytes	PAPP or SINTS or SINST1+SINST2+SINST3 on 2 bytes
1	Horodate	Value 1
2	/	Value 2 = value read at Horodate+2seconds
...	/	...
60	/	Value n = value read at Horodate+2xn seconds

After the transmission, the table is cleaned and acquisition restarted.

3.1.1.5 Interface objects

To connect to the apparent power curve buffered, the downstream device has to use the following interface:

Object Type: 1104 - M_ELECM
Data and Time read
PID 151 with DPT_DateTime (19.001)

Power read
PID 147 with DPT_Power (9.024)

Date/Time as only to be read on sequence 1 and then power from sequence 1 to 60.

Object type is described in Ref 11

3.1.2 For ZigBee

3.1.2.1 For the historical physical layer

(**): only three-phase

3.2 Reception

In case of change in the TIC mode, in KNX protocol the datapoint Type of TIC: DPT_Type_TIC (00: None, 01: Historic Moonphase, 02 : Historique triphasé, 03 : Standard Monophasé, 04 : Standard Triphasé) is sent by the radio module on the smartmeter. The downstream device shall adapt

3.2.1 Reception at power on

NOM-ERL-MEE-FC-001	Receive data when ERL is started in consumer mode	1.0
The downstream interface must be able to receive the following data at the start of the ERL (excepted if the meter associated is a producer meter).		
Class :	Non-functional	Verif. level :
Upstream Requirement(s) : Derived		

3.2.1.1 Historical physical layer, Single Phase:

TIC ERDF Labels	Information TIC
ADCO	Meter's address
OPTARIF	Chosen pricing plan

TIC ERDF Labels	Information TIC
ISOUSC	Purchased current
PTEC	Current billing period
ADPS	Purchased Power Exceeding Warning

3.2.1.2 Historical physical layer, Three-PHASE:

TIC ERDF Labels	Information TIC
ADCO	Meter's address

Bit 17 of STGE	State of the remote-information output
Bits 19 & 20 of STGE	Euridis communication output state

TIC ERDF Labels	Information TIC
Bits 21 & 22 de STGE	Status CPL
Bit 23 of STGE	CPL synchronization
Bits 24 & 25 of STGE	Color of the day for the time history contract.
Bits 26 & 27 of STGE	Colour of the following day for the historical contract TEMPO

Note 1: instantaneous value, data without DateTime stamp

3.2.2 Reception on change

NOM-ERL-MEE-FC-002	Receive data when they are updated	1.0
The downstream interface must be able to receive some specific data, on change of value. The list of these data is below.		
Class :	Non-functional	Verif. level :
Upstream Requirement(s) :	Derived	

3.2.2.1 Historical physical layer, Single Phase:

TIC ERDF Labels	Information TIC
ADCO	Meter's address
PEJP	Start EJP prior notice (30 min)
PTEC	Current billing period
DEMAIN	Tomorrow's color
ADPS	Purchased Power Exceeding Warning

3.2.2.2 Historical physical layer, Three-PHASE:

TIC ERDF Labels	Information TIC
ADCO	Meter's address
PEJP	Start EJP prior notice (30 min)
PTEC	Current billing period
DEMAIN	Tomorrow's color
ADIR1	Alert of current exceeding subscribed value per phase
ADIR2	Alert of current exceeding subscribed value per phase
ADIR3	Alert of current exceeding subscribed value per phase
PPOT	Voltage presence

3.2.2.3 Standard physical layer, Single Phase and Three-PHASE:

TIC ERDF Labels	Information TIC
ADSC	Meter's Secondary address
VTIC	Version of the TIC
NGTF	Name of the supplier pricing grid
LTARTF	Current supplier pricing label
Bits 10 à 13 of STGE	Current price on supply contract
Bits 14 et 15 of STGE	Current tariff on the network contract.
PREF	Apparent ref. power ¹
Bit 7 of STGE	Reference power exceeded ¹
PCOUP	Apparent cutoff power
Bits 28 & 29 of STGE	Moving peak prior notices ¹
Bits 30 & 31 of STGE	Moving peak (PM)
DPM1	Start of Moving Peak 1 + timestamp
FPM1	End of Moving Peak 1 + timestamp
DPM2	Start of Moving Peak 2 + timestamp
FPM2	End of Moving Peak 2 + timestamp
DPM3	Start of Moving Peak 3 + timestamp
FPM3	End of Moving Peak 3 + timestamp
MSG1	Short message
MSG2	Ultra short message

TIC ERDF Labels	Information TIC
PRM	Point of measurement report
Bits 0 of STGE	State of dry contact
RELAIS	State of 8 relays
NJOURF	Number of the current day in the calendar
NJOURF+1	Number of the next day in the calendar
PJOURF+1	Next day profile
PPOINTE	Next high day profile
Bits 1 to 3 of STGE	State of the breaker
Bit 4 of STGE	State of the DNO (Distribution Network Operator) cover terminal ¹
Bit 6 of STGE	Excess voltage on one of the phases ¹
Bit 9 of STGE	Active power direction ¹
Bit 16 of STGE	Downgraded clock mode (loss of the internal clock's timestamp) ¹
Bit 17 of STGE	State of the remote-information output
Bits 19 & 20 of STGE	Euridis communication output state
Bits 21 & 22 of STGE	Status CPL
Bits 24 & 25 of STGE	Color of the day for the time history contract.
Bits 26 & 27 of STGE	Colour of the following day for the historical contract TEMPO

(*) : do not send if the value is identical to bits 10 to 13 of STGE

Note 1: instantaneous value, data without DateTime stamp

3.2.3 Reception on request

NOM-ERL-MEE-FC-003	Receive data requested	1.0
The downstream interface can ask some data by request.		
Class :	Non-functional	Verif. level :
Upstream Requirement(s) : Derived		

NOM-ERL-AER-FC-001	Manage the data asked on request and not available in the frame sent by ERL	1.0
A data asked by the downstream equipment can be absent from the teleinformation because it depends on another kind of contract. In this case, the value of this data is a value meaning "not available". If all the data asked on request are "not available", an error must be reported, using the MMI to the user. It could be because the teleinformation is not received by the ERL.		
Class :	Non-functional	Verif. level :
Upstream Requirement(s) : Derived		

3.2.3.1 Historical physical layer, Single Phase and Three-Phase:

TIC ERDF Labels	Information TIC
ADCO	Meter's address
OPTARIF	Chosen pricing plan
ISOUSC	Purchased current
BASE	Basic option index
HCHC HCHP	Off-Peak Hours Full Hours
EJPHN EJPHPM	EJP option Index Normal hours Moving Peak Hours
BBRHCJB BBRHPJB BBRHCJW BBRHPJW BBRHCJR BBRHPJR	Tempo option Index : Off peak hours blue days Peak hours blue days Off peak hours white days Peak hours white days Off peak hours red days Peak hours red days
PEJP	Start EJP prior notice (30 min)

TIC ERDF Labels	Information TIC
PTEC	Current billing period
DEMAIN	Tomorrow's color
PAPP	Apparent power
HHPHC	Peak Hour Off-Peak Hour Schedule
MOTDETAT	Meter's status word
IINST (*)	Instant current in Amperes
IMAX (*)	Maximum capacity used
IINST1 (**)	Instant current Phase 1
IINST2 (**)	Instant current Phase 2
IINST3 (**)	Instant current Phase 3
IMAX1 (**)	Maximum capacity used Phase1
IMAX2 (**)	Maximum capacity used Phase2
IMAX3 (**)	Maximum capacity used Phase3
PMAX (**)	Three phase maximal power reached
PPOT (**)	Voltage presence

(*) : single phase only

(**): three phases only

3.2.3.2 Standard physical layer, Single Phase and Three-Phase

TIC ERDF Labels	Information TIC
ADSC	Meter's Secondary address
VTIC	Version of the TIC
DATE	Current date and time
NGTF	Name of the supplier pricing grid

TIC ERDF Labels	Information TIC
LTARTF	Current supplier pricing label
Bits 10 à 13 de STGE	Current price on supply contract
NTARF	Number of the current tariff index
Bits 14 et 15 de STGE	Current tariff on the network contract.

PPOINTE	Next high day profile
Bits 1 à 3 de STGE	State of the breaker
Bit 4 de STGE	State of the client terminal-hider
Bit 6 de STGE	Excess voltage on one of the phases
Bit 8 de STGE	Producer/consumer operation
Bit 9 de STGE	Active power direction
Bit 16 de STGE	Downgraded clock mode (loss of the internal clock's timestamp)
Bit 17 de STGE	State of the remote-information output
Bits 19 & 20 de STGE	Euridis communication output state
Bits 21 & 22 de STGE	Status CPL
Bit 23 de STGE	CPL synchronization

TIC ERDF Labels	Information TIC
Bits 24 & 25 de STGE	Color of the day for the time history contract.
Bits 26 & 27 de STGE	Colour of the following day for the historical contract TEMPO
EAIT	Total active power injected
ERQ1	Total reactive power Q1
ERQ2	Total reactive power Q2
ERQ3	Total reactive power Q3
ERQ4	Total reactive power Q4
SINSTI	Apparent instant power injected
SMAXIN	Apparent max. injected power n
SMAXIN-1	Apparent max. injected power n-1
CCAIN	Point n on the active load drawn curve
CCAIN-1	Point n-1 on the active load drawn curve

(*) : single phase only

(**): three phases only

3.2.4 Reception on configured demand

3.2.4.1 Initialisation of data to receive on configured demand.

NOM-ERL-MEE-FC-004	Receive data configured on demand	1.0
The data asked in this mode must belong to the following lists.		
Class :	Non-functional	Verif. level :
Upstream Requirement(s) : Derived		

3.2.4.1.1 Historical physical layer

TIC ERDF Labels	Information TIC
-----------------	-----------------

TIC ERDF Labels	Information TIC
BASE	Basic option index
HCHC HCHP	Off-Peak Hours Full Hours
EJPHN EJPHPM	EJP option Index Normal hours Moving Peak Hours
BBRHCJB BBRHPJB BBRHCJW BBRHPJW BBRHCJR BBRHPJR	Tempo option Index : Off peak hours blue days Peak hours blue days Off peak hours white days Peak hours white days Off peak hours red days Peak hours red days
PAPP	Apparent power

3.2.4.1.2 Standard physical layer, Single Phase and Three-Phase

TIC ERDF Labels	Information TIC
EASF01 EASF02 EASF03 EASF04 EASF05 EASF06 EASF07 EASF08 EASF09 EASF10	Supplier active power drawn index01 index 02 index 03 index 04 index 05 index 06 index 07 index 08 index 09 index 10
EASD01 EASD02 EASD03 EASD04	Distributor active power drawn index01 index 02 index 03 index 04
SINSTS (*)	Apparent instant drawn power
SINSTS1 (**)	Apparent instant drawn power phase 1
SINSTS2 (**)	Apparent instant drawn power phase 2
SINSTS3 (**)	Apparent instant drawn power phase 3
SINSTI	Apparent instant drawn power injected

(*) : single phase only

(**): three phases only

3.2.4.2 Reception of data on configured demand

If the data asked is not available (depending on the type of contract, meter...), it is not sent.

The frame received includes only data available (belonging to the list of data and used with the current configuration of the meter and the contract)

3.2.5 Reception of alarms

When the alarm “exceeding power contract” is raised in the TIC, ERL sends this information to all devices interested in as soon as possible (The alarm is sent in less than 2 seconds).

All current processing must be completed. No new processing started before emission of the alarm.

3.3 Emission

3.3.1 Emission of the list of data to be sent on configured demand

NOM-ERL-PTI-FC-001	Send the list of data to receive from ERL on configured demand	1.0
The downstream equipment must send the list of data to receive from ERL on configured demand. The data asked in this mode must belong to the lists of § 3.2.4 If the data asked is not available (depending on the type of contract, meter..), it is not sent.		
Class : Non-functional	Verif. level :	
Upstream Requirement(s) : Derived		

3.3.2 Emission of requests for specific data

NOM-ERL-PTI-FC-002	Ask the value of specific data needed in the lists below	1.0
The downstream equipment can ask the value of some specific value at any moment. These data are listed in § 3.2.3. Data not in the list below cannot be asked. If the data asked is not available (depending on the contract, nature of meter...), it is sent with the value "Not Available"		
Class : Non-functional		
Upstream Requirement(s) : Derived		Verif. level :

3.3.3 Emission of data

NOM-ERL-PTI-FC-003	Use the right datapoint when sending data to the ERL in KNX protocol	1.0
Downstream equipment must use the right existing datapoints to send the data in KNX protocol. Common emitted datapoints: <ul style="list-style-type: none">- Dynamic mode start: DPT-_Start- Index emissions trigger: DPT_trigger- Date + Horodate if not available in TIC: DPT_DateTime- Price information out: DPT_TariffPriceCommodity		
Type of TIC: DPT_Type_TIC (00: None, 01 : Historic Moonphase, 02 : Historique triphasé, 03 : Standard Monophasé, 04 : Standard Triphasé)		
Class : Non-functional		Verif. level :
Upstream Requirement(s) : Derived		

4 CONFIGURATION (ADDITION AND REMOVAL OF DEVICES)

ADR-NTW-ZIG-FC-001	Respect the ZigBee Home Automation profile 1.2	1.0
The utilisation of ZigBee must be compliant with the ZigBee Home Automation profile 1.2 ref (10)		
Class :	Non-functional	Verif. level : verification
Upstream Requirement(s) : Derived		

ADR-NTW-ZIG-FC-002	Respect the KNX PB procedure	1.0
The utilisation of KNX must be compliant with the PB procedure, refer to ref (3)		
Class :	Non-functional	Verif. level : verification
Upstream Requirement(s) : Derived		

ADR-ERL-NTZ-FC-001	Implement the possibility to create a link with ERL	1.0
To be able to create a KNX or a ZigBee link with the ERL, the downstream equipment must have a push button or any MMI equivalent to launch the association procedure.		
Class :	Non-functional	Verif. level : tests
Upstream Requirement(s) : Derived		

4.1 ZigBee

ADR-ERL-NTZ-FC-002	Implement enhanced ZigBee security	1.0
The downstream equipment interface must implement security in order to control the authorization of the devices and frame protection.		
Security must be managed using :		
<ul style="list-style-type: none"> • An install code to input into the trust centre device in order to encrypt the frames 		
Class :	Non-functional	Verif. level : tests
Upstream Requirement(s) : Derived		

The trust centre can be the downstream equipment to be binded with the ERL or any equipment already present.

ADR-ERL-NTZ-FC-003	Implement ZigBee security	1.0
The two ZigBee security types are :		
<ul style="list-style-type: none"> • Standard security : A Push Button on the downstream device and a Push Button on the ERL (Push button realized by remote control) • Enhanced security: an action on the trust centre device and the frames encrypted using the install code as an encryption key. 		
The downstream equipment interface must implement the two levels of security. For the Push Button procedure, refer to ref (7)		
Class :	Non-functional	Verif. level : tests
Upstream Requirement(s) : Derived		

4.2 KNX

The description of the association procedure is below.

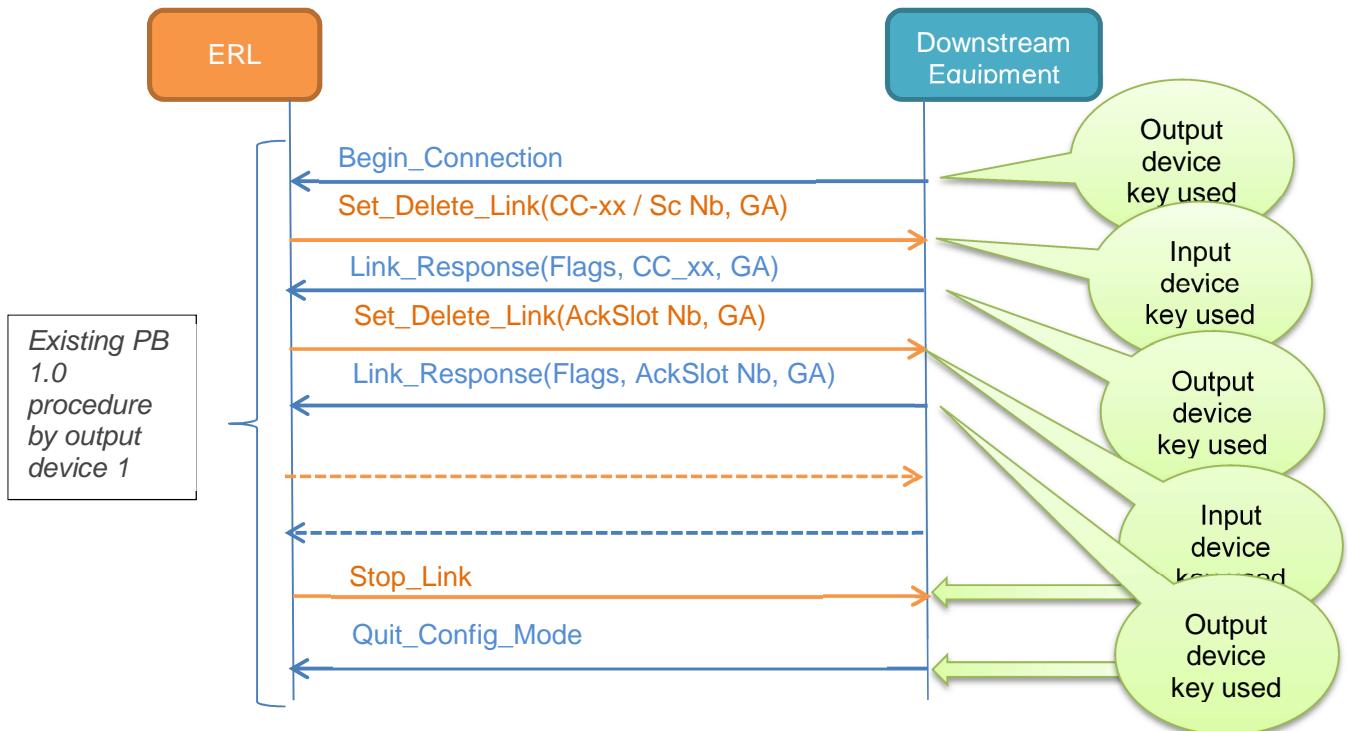

ADR-ERL-NTK-FC-002	Implement enhanced KNX security	1.0
The downstream equipment interface may implement enhanced security in order to control the authorization of the devices and frame protection.		
It must be possible to enter the ERL install code into the downstream device MMI in order to encrypt the frames.		
Class :	Non-functional	Verif. level : tests
Upstream Requirement(s) : Derived		

ADR-ERL-NTK-FC-003	Implement KNX security	1.0
The two KNX security types are :		
<ul style="list-style-type: none"> • Standard security : A Push Button on the downstream device and a Push Button on the ERL (Push button realized by remote control) • Enhanced security: an action on the downstream device and the frames encrypted using the install code as an encryption key. 		
The downstream equipment interface must implement at least the standard security or may implement the two levels of security.		
Class :	Non-functional	Verif. level : tests
Upstream Requirement(s) : Derived		

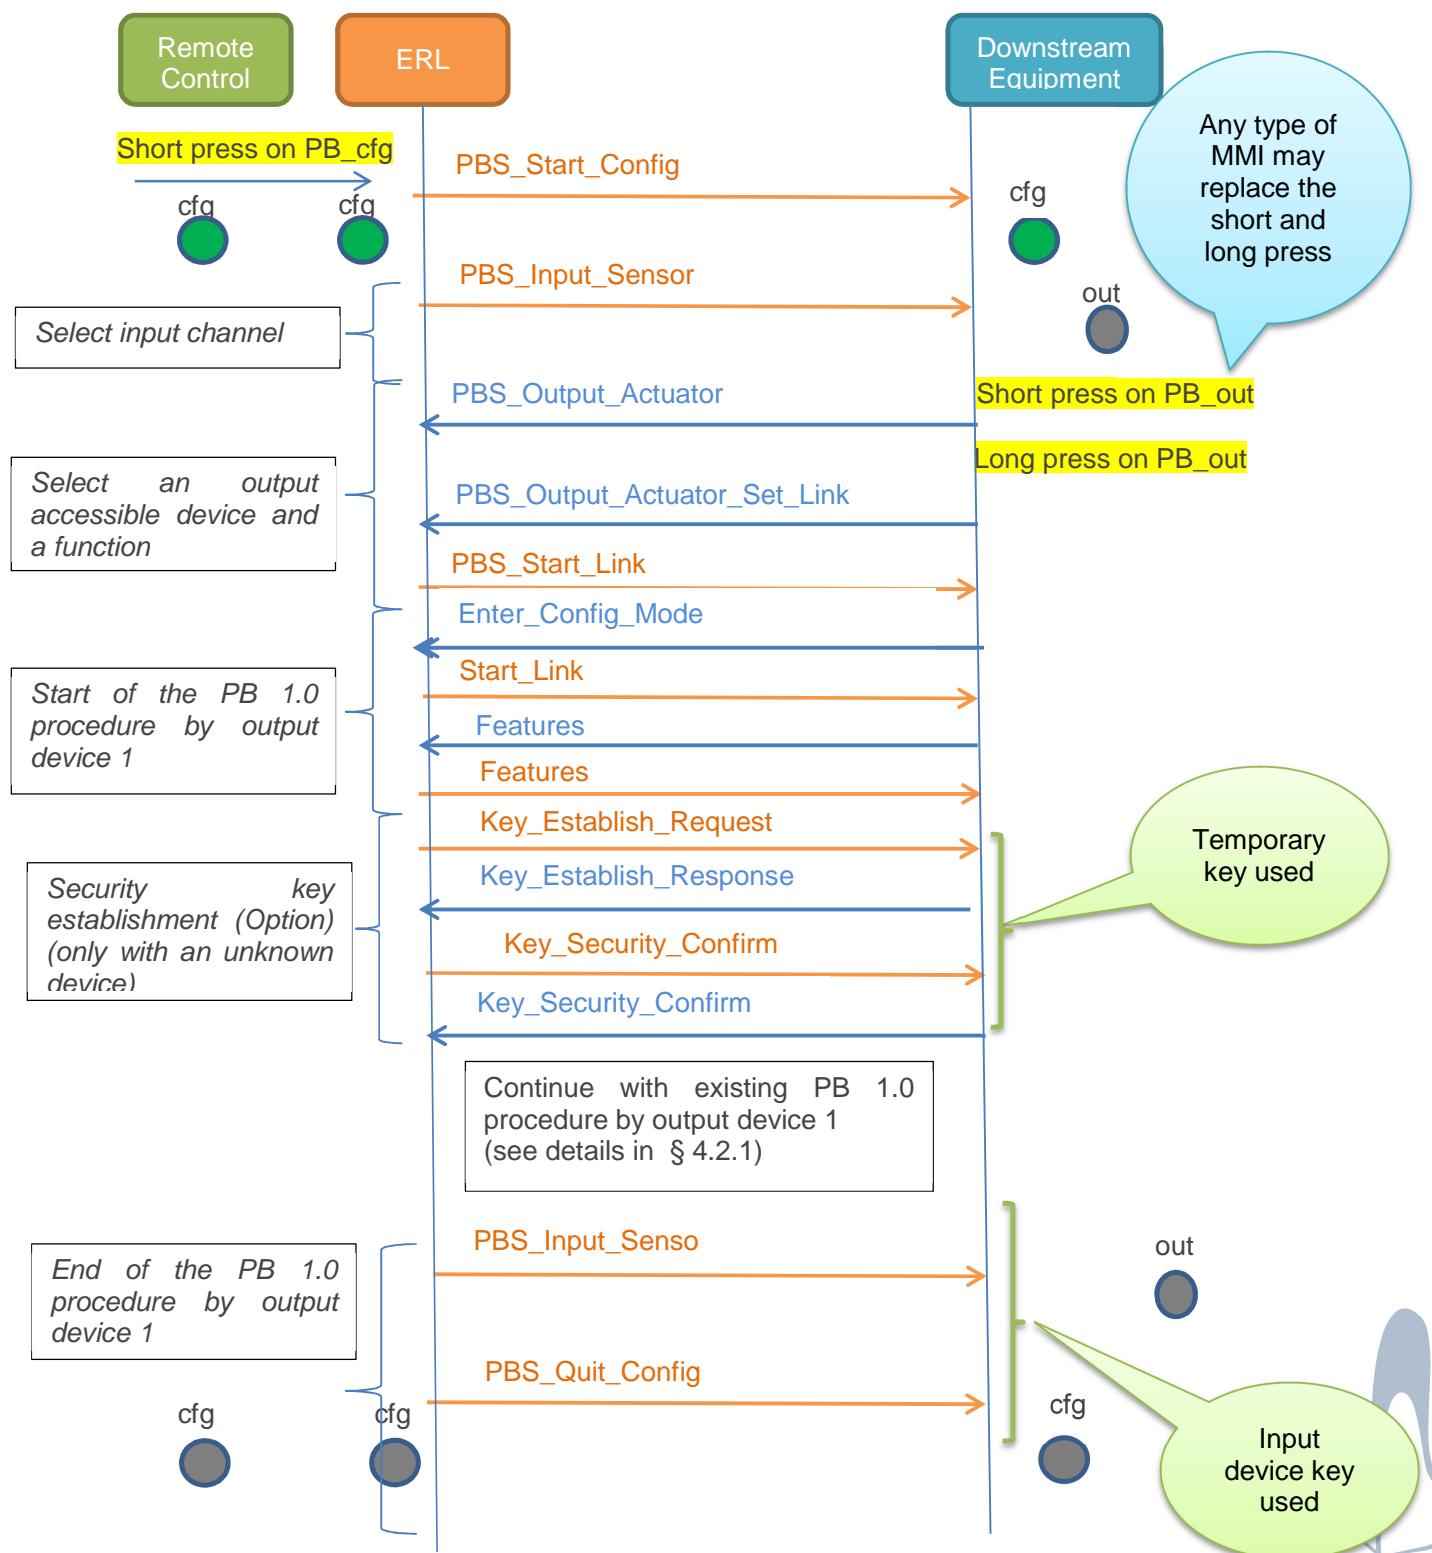

4.2.1 Existing PB 1.0 procedure

The diagram below is common to both procedures (standard and enhanced security).

It is used and indicated in a square inside the diagrams of each kind of security.

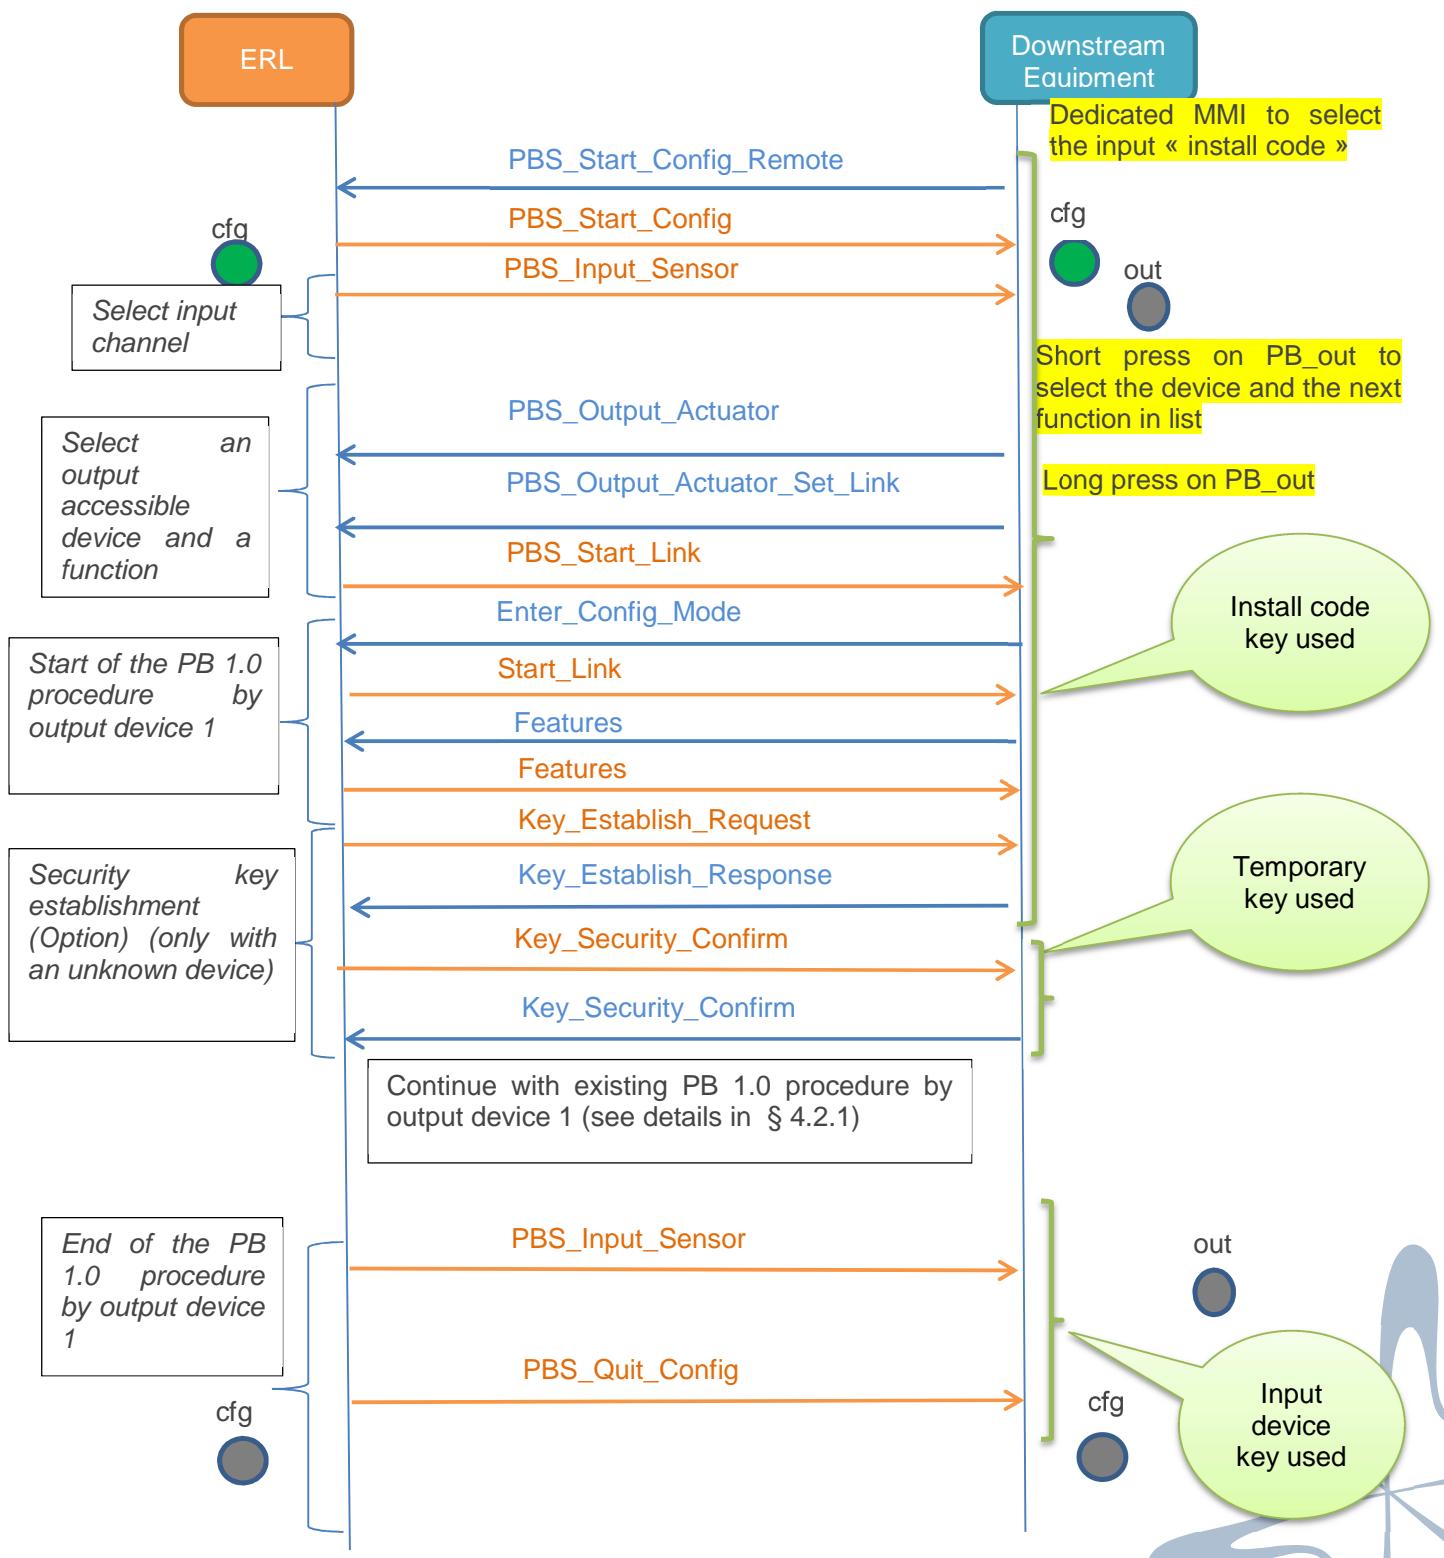

4.2.2 Standard Security

4.2.3 Enhanced Security

In this mode and for KNX, the remote control is not used. No push of button to do on the ERL

Details of frames:

4.3 Set-up procedure with the two levels of security

4.3.1 Standard security

ADR-NTW-CNF-FC-001	Implement the standard security association.	1.0
The downstream interfaces must implement the standard security association.		
Class : Non-functional	Verif. level : Test	
Upstream Requirement(s) : Derived		

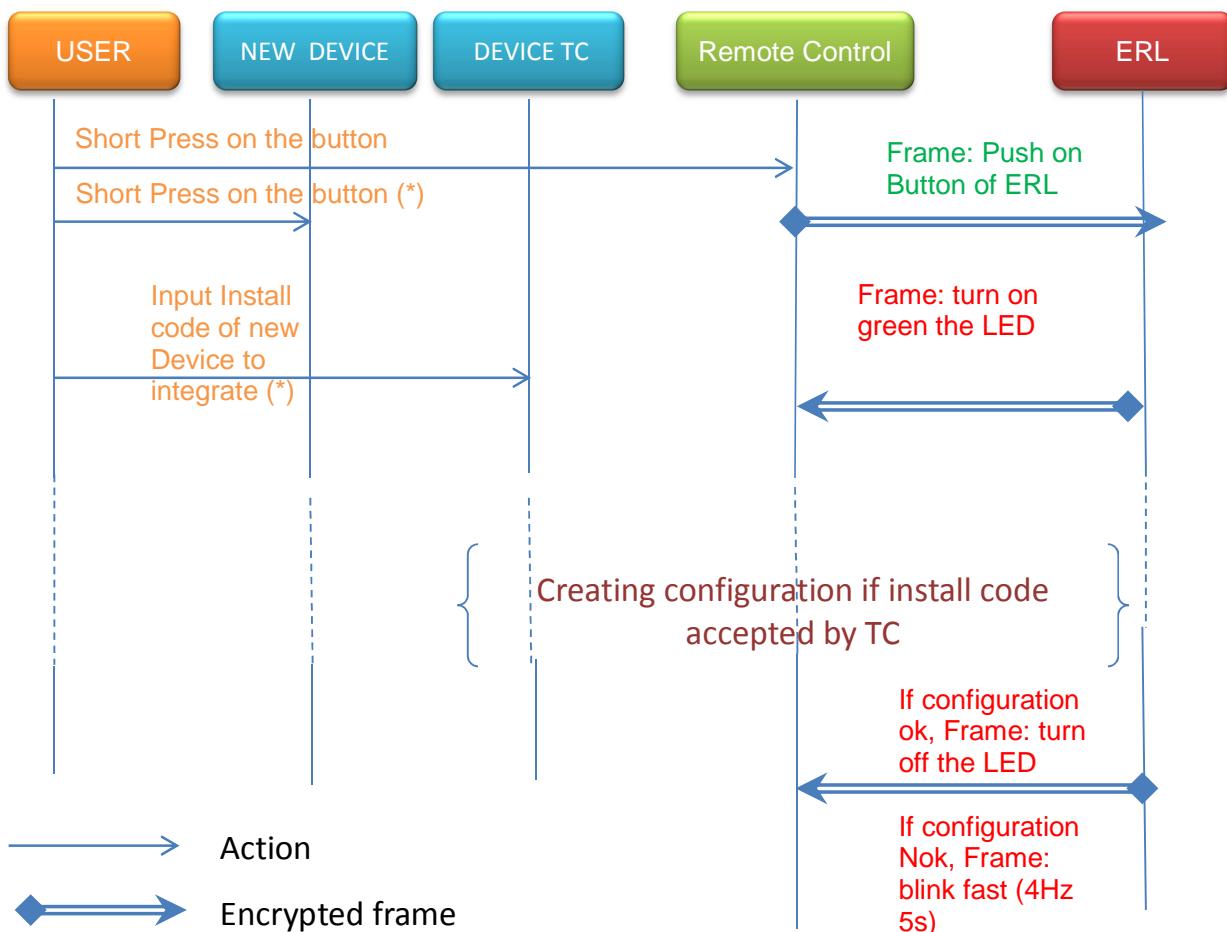

*: with ZigBee protocol, there no priority for doing the two "Short Press on the button" actions. With KNX, the first action "Short Press on the button" must be done on the remote

4.3.2 Enhanced security

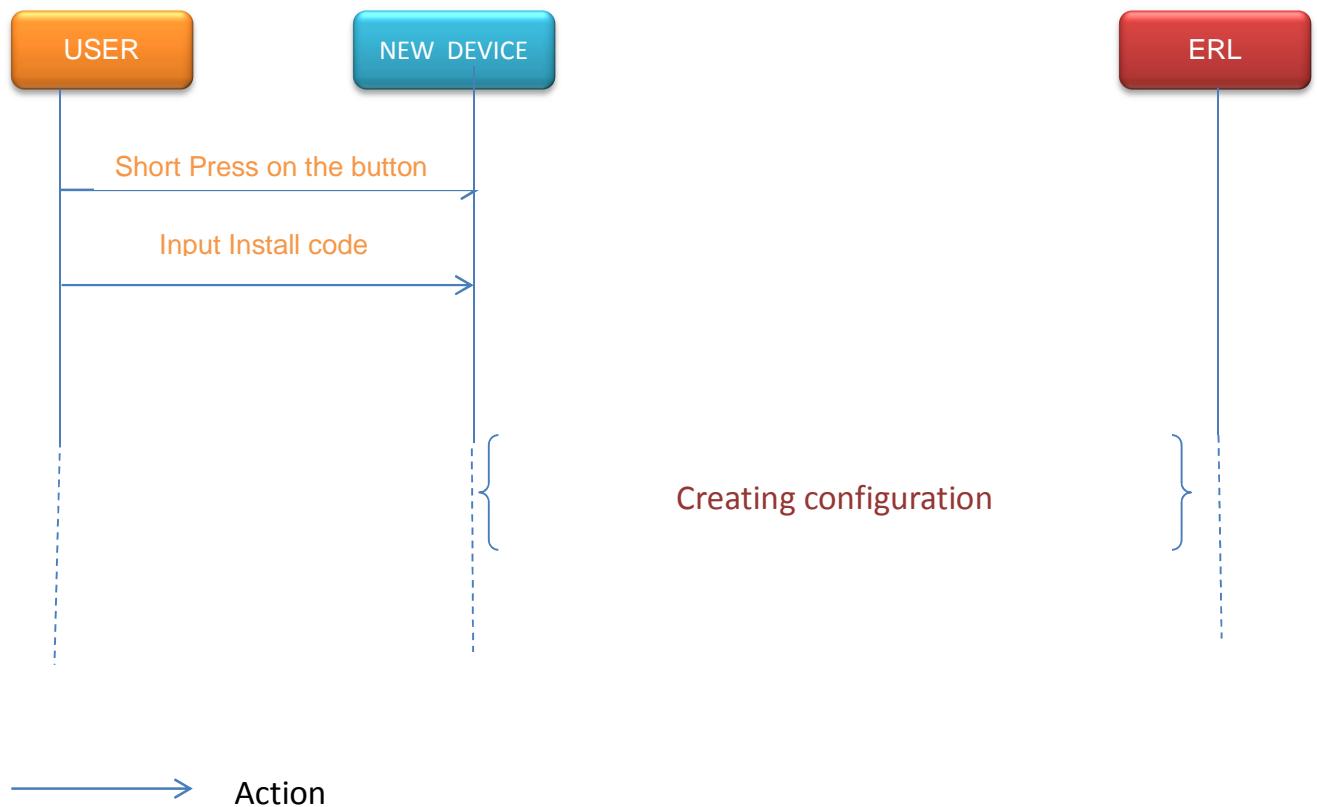

4.3.2.1 ZigBee

ADR-NTW-CNF-FC-002	Implement the ZigBee enhanced security association.	1.0
The downstream interfaces must implement the ZigBee enhanced security association as described below.		
Class : Non-functional	Verif. level : Test	
Upstream Requirement(s) : Derived		

4.3.2.2 KNX

ADR-NTW-CNF-FC-003	Implement the KNX enhanced security association.	1.0
The downstream interfaces must implement the KNX enhanced security association as described below.		
For KNX enhanced security, no need of the remote control for the association.		
Class : Non-functional		Verif. level : Test
Upstream Requirement(s) : Derived		

5 SPECIAL EVENTS

5.1 The owner of the meter contract is modified

ADR-ERL-OWN-FC-001	Adapt the downstream equipment to the modification of the owner of the meter contract	1.0
In case of modification of the owner of the meter contract, the downstream equipment storing the consumption data must be able to erase all the information stored, on customer action.		
Class : Non-functional	Verif. level : tests	
Upstream Requirement(s) : Derived		

5.2 Change of energy supplier

The downstream interfaces shall adapt automatically to a new contract.

5.3 A new firmware is downloaded on the ERL

During a firmware download of the ERL, all transmissions are stopped between ERL and the downstream equipment.

Before starting the download of a new firmware, all the downstream equipment will be notified (data “overflow of subscribed power” is set).

At the end of the upgrade, the ERL restarts automatically.
