# Statistics <br> Lecture 6 <br> Part two <br> Data analysis: Descriptive statistics 

## Lecture objectives <br> $\square$ Describing and summarizing data

- Describing and summarizing numerical data/ score data ( quantitative)

## Introduction

After having seen how categorical data (qualitative data) can be described and summarized, this lecture introduces how numerical (score data) can also be descibed and summarized. According to (Howitt \& Cramer, p. 54), 'because score data contains much more information than category data, there are many more appropriate ways of describing and summarizing score data'

Fig 7.1: Essential descriptive statistics for score variables (Howitt \& Cramer, 2005, p.54)

## Score data

$\longrightarrow$

| Tables <br> Frequency table <br> (usually using bands <br> of scores) <br> or |  |
| :---: | :---: |
| Diagrams <br> (optional) <br> Hystogram <br> polygon | Numerical <br> indexes |
|  |  |
| Number of scores |  |
| Mean, median and |  |
| mode |  |
| Standard deviation |  |
| ( or variance). Use |  |
| standard estimate if |  |
| you wish |  |
| range |  |
| Minimum and |  |
| maximum value |  |

In addition to the frequency, we can use also use relative frequency and cumultative frequency. * Relative frequency refers to how often something happens divided by the number of observations or $\mathbf{f} / \mathbf{n}$ ( as seen in the previous slides)

* Cumulative frequency is obtained by summing the frequencies (relative frequencies) of all classes up to the specific class

## Fig 1: Frequency distribution table (example of employees weekly earnings frequencies)

| Weekly earnings (dollar) | Frequency |
| :---: | :---: |
| 801 to 1000 | 9 |
| 1001 to 1200 | 22 |
| 1201 to 1400 | 39 |
| 1401 to 1600 | 15 |
| 1601 to 1800 | 9 |
| 1801 to 200 | 6 |

## Fig 2: Frequencies/relative frequencies of students marks ( $\mathrm{n}=50$ )

| Class marks | Frequency | Relative frequency |
| :---: | :---: | :---: |
| $<10$ | 13 | 0.26 |
| 10 | 8 | 0.16 |
| 12 | 12 | 0.24 |
| 13 | 10 | 0.2 |
| 14 | 4 | 0.08 |
| 15 | 2 | 0.04 |
| 17 | 1 | 0.02 |

| Class marks | Frequency | Cumulative frequency |
| :---: | :---: | :---: |
| $<10$ | 13 | 13 |
| 10 | 8 | 21 |
| 12 | 12 | 33 |
| 13 | 10 | 43 |
| 14 | 4 | 47 |
| 15 | 2 | 49 |
| 17 | 1 | 50 |

## Graphing score data: <br> 1.Histograms

A hystogram can be drawn from a frequency distribution, a relative frequency distribution or a percentage distribution. The bars in a hystogram are drawn adjacent to each other with no gap between them.

* The classes are marked on the horizontal axis and the frequencies, relative frequencies or percentages are represented by the heights of the bars

Hystogram representing students marks frequencies

## Results of the exam

An example of histogram in Excel

2. Polygon representing students scores

Frequency Polygon

## Task 1

Calculate the relative, cumulative and percent frequencies of the following and place them in a frequency distribution table.
Students marks are as follows:
$\square 3$ students got from 1 to 4

- 15 students got from 5 to 9
- 21 student got from 10 to 13
- 5 students got from 14 to 16
- 3 students got from 17 to 19

## Task 2

1. Is a frequency polygon similar to a line graph or different?
2. What is the difference between a scatter plot and a line graph?
3. What is the difference between frequency percentage and relative frequency?
4. What is the importance of cumulative frequencies?

## Number of students: 47

| Class marks | frequency | Relative <br> frequency | Percentage | Cumulative <br> frequency |
| :---: | :---: | :---: | :---: | :---: |
| 1 to 4 | 3 | 0.06 | $6 \%$ | 3 |
| 5 To 9 | 15 | 0.32 | $32 \%$ | 18 |
| 10 to 13 | 21 | 0.45 | $45 \%$ | 39 |
| 14 to 16 | 5 | 0.11 | $11 \%$ | 44 |
| 17 to 19 | 3 | 0.06 | $6 \%$ | 47 |
