

Therapeutic glycerin soap containing all its

Therapeutic soap

Therapeutic glycerin soap containing all its

I made a thick soap shampoo size I consider treatment with this soap because I healed a serious [dental](#) infection in autumn 2013, the swelling was very disturbing, one night I just used a brush tooth has packed this soap and I applied on and around my infected tooth and that the wound that had developed on the inside of the cheek live view of my infected tooth, the next morning I saw a significant improvement and I continued worked, every meal I repeated the same treatment, a day after the first treatment, the improvement was very obvious each day there was an improvement, it was just a good week to be sure that the infection was cured, and for several weeks when I felt a tooth sensitivity this, I applied the treatment each meal, this sensitivity could leave and return several days, again I applied the treatment, I finally have more sensitivity in this tooth (or has other teeth) for several months.

I had a filling in this tooth has several years I have lost at least a good part of the filling, I even had some break, I always refused my dentist for the tooth involved, j ' I had several fillings and so I have a [dental](#) constitution that deserves serious followed, however it has several years that I was not going to the [dental clinic](#);

in 1987 I was able to defeat a serious dental infection without medication and without help, however I agreed thereafter to take a antibiotic prescribed by my dentist because I was receiving [dental care](#) a few days later.

I thought of taking an antibiotic during my dental infection in autumn 2013 because unlike my tooth infection, 1987, my immune system alone could not overcome the infection, before I wanted to try my soap, which I tried and it was certainly a good decision, doctors usually advice to use the least possible antibiotics. This soap is very useful for treating sunburn, it is not a Sun cream, when I wash, I only properly applied my soap on my favorite sun for a few seconds, then I normally rinsed with the water.

I always use my soap to wash my skin, my hair and beard, I started my soap made and used a little before 2000.

This soap is made with cold process without the use of alcohol, I use the same amount by volume of olive oil as a solution of sodium hydroxide concentration of 3 mol / liter at the beginning the reaction is slow, but I guess when a little glycerin to form, trialcohol helps the olive oil dissolve in water and react with sodium hydroxide, I stirred occasionally during an afternoon by example, the next morning I added about as much water as the mixture I continuous stirring occasionally, yet the next day I added water and I continue to stir occasionally during the day, I repeat one more day, here is my estimate of the constitution of my soap mass:

11.9625% soap, 1.15% glycerol, .375% Na₂CO₃, 86.5125% water,

my soap is in the form of a thick shampoo tends to harden over time, after more than a week or two it normally takes me to add a little water and I brew because otherwise the soap is too thick to be used as a shampoo.

As long soap is manufactured, the point of view of its possible [financial](#) ☐ price, it is not competitive to other soap, so there is certainly not possible to sell commercially, at least for now, and even if I made solid soap bars for easy shopping sale, it would lose some of its therapeutic quality, because when I made this soap dried, it loses approximately 30.71% of the non-volatile material in comparison with salt nonvolatile sea, if we evaporated salty sea water, you lose about 1/8 or 12.5% of salt, approximately 12.5% of the salt thus evaporated with water (if I remember correctly) , here is a picture that goes what remains of a volume of a soap filled container of 120 ml and dried, the small piece of dried soap approximately 12.5 grams of the pin next to a machine, is all that remains, I think my soap practically the density of water:

☐

The following picture shows my soap as a white shampoo in a thick [plastic container](#) ☐, it is compared to a soap that I got with a vegetable oil which I do not know his constitution:
